

Clearform Form Builder - Product Features

The Core Problem We Solve

Before a reviewer opens a submission, Clearform tells them: is this response worth reading or not?

Think of it like this: imagine you are a recruiter with 200 job applications. Right now you open every single one and read it before you know if it is any good. Clearform shows you a score on the outside before you open it. Like a label that says "this one is strong" or "this one is vague, skip it."

For each response submitted, every question and answer gets a quality score. This score is the signal that tells you: should I read this response or just skip it entirely.

How It Works (The Flow)

```
graph TD; A[Person types answer] --> B[AI reads it in real-time]; B --> C[Shows quality signal (Red/Amber/Green)]; C --> D[Suggests how to improve]; D --> E[Decides what question to ask next]; E --> F[Better input collected automatically];
```

AI-Powered Features (What Makes Us Different)

AI Feature 1: Response Quality Scoring

Before you open any submission, you see a quality badge: Red, Amber, or Green. This badge is calculated by scoring every text answer in the submission. Red means vague or incomplete. Amber means okay but could be better. Green means detailed and actionable. You can filter your inbox to only show Green responses and skip the rest entirely.

Configurable Scoring Criteria:

You select which criteria badges matter for your form: - **Length Badge**: Flags answers that are too short (1-2 words) versus detailed responses - **Specificity Badge**: Detects vague words like "good" or "nice" versus concrete details - **Relevance Badge**: Identifies off-topic answers versus on-topic responses - **Completeness Badge**: Catches partial answers versus fully answered questions

Toggle each badge on or off per form. If you only care about length and specificity, turn off relevance and completeness. The overall Red/Amber/Green score adapts based on your selected criteria.

AI Feature 2: Real-time Suggestions

As users type their answer, they see a visual traffic light indicator (three dots: red, amber, green) that updates live. The active color lights up based on their current quality score.

If the score is Red or Amber, a suggestion appears below the input field: "Your answer could be more specific. Try adding details about what you liked." This guides users to give better answers before they submit. The traffic light and suggestions update in real-time as they improve their answer.

Why this matters: Users fix quality problems themselves instead of you following up later.

AI Feature 3: Auto-reject Low Quality Submissions

Turn on the auto-reject toggle in form settings to set a minimum quality threshold. If someone tries to submit a form with Red-scored answers, Clearform blocks the submission entirely and

shows: "Please provide more detail to submit."

This prevents spam and lazy responses from cluttering your database. You only get submissions that meet your quality bar. Toggle on/off per form based on your needs.

Use case: Job applications where you need detailed answers about experience, not one-word responses.

AI Feature 4: AI Dynamic Questions

The form owner sets up 10 questions in the builder. But the respondent does not see all 10 in a fixed order. Based on what someone types, the AI reads their answer and decides what question to ask next.

Example: - User answers: "The product was slow" - AI detects keyword "slow" - AI shows: "Which specific feature felt slow?" - Next question changes based on previous answer

How to set it up:

You create a question bank with trigger keywords:

Question Bank:

1. "Which features do you use most?"

Triggers: features, functionality, tools

2. "What price would be fair?"

Triggers: price, cost, expensive, cheap

3. "How can we improve support?"

Triggers: support, help, service, customer service

The AI matches user answers to triggers and shows the most relevant follow-up. This eliminates need for complex manual branching trees. The AI handles the logic.

Settings Toggle: AI vs Manual Logic

You choose how questions flow in your form:

- **Manual If/Else Logic:** We use Typeform's proven conditional logic system. Set rules like "If answer is Yes, show Question 5" or "If user selects Option A, jump to Section 2." Build branching paths with AND/OR conditions. This works for fixed-choice questions (multiple choice, yes/no).
- **AI-Driven Logic:** On top of the manual logic, add AI intelligence for text-based questions. AI reads open-ended answers and decides which question from your bank is most relevant. Perfect for questions where you cannot predict every possible answer path.
- **Hybrid Mode:** Combine both. Use manual if/else for multiple choice questions. Use AI logic for text questions like "What did you think?" Get the best of both worlds.

All tiers get manual if/else logic. AI-driven logic is premium only.

AI Feature 5: Response Summaries & Insights

Per-Response Summaries:

For each submission, AI generates a 2-3 sentence summary showing key points. This summary displays in your inbox next to the response. You can read the summary and decide if the full response is worth opening.

Example summary: "User loves product speed but frustrated with mobile app crashes. Wants offline mode feature. Willing to pay more for premium tier."

Dashboard Insights:

The dashboard shows auto-generated insights across all responses: - "40% of users mention shipping delays as their main complaint" - "High-scoring responses frequently praise the support team" - "Users who rated 9-10 most often mention 'ease of use' and 'clean design'"

These insights save hours of manually reviewing hundreds of responses to find patterns.

Standard Form Features

Most form builders have these capabilities. We have them too and to be thorough, we are including them here:

Form Feature 1: Question Types

Text Questions: - Short Text (single line for names, emails, short answers) - Long Text (paragraph text for detailed feedback, descriptions) - Email (with format validation) - Phone Number (with country code and format validation) - Number (with min/max range validation)

Choice Questions: - Multiple Choice - Single Select (radio buttons, pick one option) - Multiple Choice - Multi Select (checkboxes, pick multiple options) - Dropdown (select from long list, searchable if 10+ options)

Scale Questions: - Rating Scale (1-5 stars, hearts, thumbs up/down) - Linear Scale (0-10 slider with custom labels on each end)

Date & Time: - Date Picker (calendar selection with min/max date restrictions) - Time Picker (12-hour or 24-hour format)

File Upload: - Accept PDF, DOC, DOCX, JPG, PNG, CSV files - Configurable file size limits - Multiple file upload support - Virus scanning on upload

Validation: Built-in validation for all question types. Custom error messages. Regex support for custom patterns like employee IDs, product codes, or custom formats.

Form Feature 2: Conditional Logic (Manual Branching)

Build simple if/then rules to show or hide questions:

Show/Hide Logic: - If user selects "Yes" to "Do you have a website?", show "What is your website URL?" - If user selects "No", skip the URL question entirely

Jump Logic: - If user rates 1-6, jump to "What went wrong?" - If user rates 7-10, jump to "Thank you" page

Complex Conditions: - Chain multiple rules with AND/OR operators - If Answer A is X AND Answer B is Y, show Question C - Hide entire sections based on previous answers

This is Typeform-style conditional logic that all form builders have. We have it too.

Form Feature 3: Multi-page Forms

Split long forms into multiple pages: - Configure how many questions per page - Add page breaks wherever needed - Show progress indicator: "Page 2 of 5" or "Question 3 of 10" - Include back and next buttons for navigation - Users can review previous pages before submitting

Form Feature 4: Form Layouts

Choose how to display your form:

Single Page Layout: All questions on one scrollable page with progress bar. Best for short forms (5-10 questions).

Multi-page Layout: Questions split across pages with next/back buttons. Best for long forms (10+ questions). Less overwhelming.

Conversational Layout: One question at a time in chat-like interface. User presses Enter or clicks Next. Smooth animations between questions. Highest completion rates.

Form Feature 5: Mobile Responsive

Forms automatically resize for mobile devices. Large touch-friendly buttons. Native mobile keyboards (email keyboard for email fields, number pad for phone numbers). Minimal scrolling with auto-focus.

Form Feature 6: Custom Branding

- Remove "Powered by Clearform" footer
- Upload your logo at top of form
- Customize primary color for buttons and progress bars
- Choose fonts from Google Fonts library
- Host on custom subdomain: feedback.yourcompany.com

Forms look 100% like your brand.

Form Feature 7: Form Settings & Configuration

Basic Settings: - Form title and description (supports markdown) - Custom submit button text ("Apply Now", "Send Feedback", "Register") - Thank you message after submission (custom text or redirect to URL) - Password protection (require password to access form) - Allow/prevent multiple submissions from same user

Response Limits: - Max total responses (close after 500 submissions) - Max responses per day/week/month - Schedule auto-close on specific date and time

Form Feature 8: Integrations

Google Sheets: Every response auto-syncs to Google Sheets as new row. Syncs within 30 seconds. Column headers match question titles. One-click OAuth setup.

Google Drive: File uploads automatically save to designated folder. Organizes by form name and date. Perfect for resume collection or document gathering.

Webhooks: Push raw JSON response data to any external URL when form is submitted. Configure multiple destinations. Automatic retry if webhook fails.

Form Feature 9: Embed Options

Share Link: Standard link: clearform.io/f/your-form. Share via email, social media, QR code.

Inline Embed: Paste iframe code into your website. Form appears as part of page. Watermark-free on Pro tier.

Popup Modal: Center-screen overlay when user clicks button. Perfect for email signups or waitlists.

Slide-in Widget: Floating button in corner that expands to side drawer. Perfect for persistent feedback.

Response Management Features

Response Feature 1: Quality-Scored Inbox

The inbox view shows: - Every submission with its quality badge (Red/Amber/Green) BEFORE you open it - Sort by quality score to see best responses first - Filter to show only Green responses, hide Red entirely - Search within answer text to find specific keywords - Tag responses with custom labels: "Follow-up needed", "VIP customer", "Bug report"

Why this matters: You process 200 responses in 30 minutes instead of 3 hours because you know which ones to read and which to skip.

Response Feature 2: Response Details Page

Click any submission to see: - Full answers to all questions - Quality score per question (not just overall) - Submission timestamp - User metadata: IP address, device type, browser - Internal team comments (only visible to your team) - Response status: New, Reviewed, Archived

Response Feature 3: Team Collaboration

Add Team Members: Invite team members to collaborate on forms. Each member gets their own login.

What team members can do: - View all responses in shared inbox - Add internal comments on submissions (like Slack threads but on each response) - Tag team members with @mentions in comments - Assign responses to specific people for follow-up - Filter inbox by "Assigned to me" to see only their tasks - Star important submissions for quick access

Use case: HR team reviewing 300 job applications. Each recruiter is assigned 100. They can comment on candidates, tag each other for second opinions, and track who reviewed what.

Team seats by tier: - Free: 1 user - Starter: 2 users
- Pro: 5 users - Team: 20 users - Enterprise: Unlimited

Response Feature 4: Bulk Actions

Select multiple responses and: - Tag all at once (add "Interviewed" tag to 50 candidates) - Export selected responses to CSV - Archive old responses to clean up inbox - Delete spam submissions in bulk

Response Feature 5: Export

Download responses as CSV file with: - All answers - Quality scores per question - Submission timestamp - User metadata

Filter by date range or quality score before exporting.

Organization Features

Organization Feature 1: Folders

Organize forms into color-coded folders: - Create folders by team, project, or category - Drag and drop forms between folders - Share entire folders with team members - Archive old folders to keep workspace clean

Example: "Product Feedback" folder (blue), "Job Applications" folder (green), "Event Registration" folder (red).

Organization Feature 2: Form Duplication

Clone any form with one click. Duplicate includes: - All questions and logic - All settings - Branding and styling

Useful for creating similar forms or A/B testing variations.

Organization Feature 3: Draft Mode

Save forms as drafts while building: - Preview drafts before publishing - Make changes without affecting live form - Publish when ready - Unpublish live forms back to draft

Organization Feature 4: Form Archive

Archive old forms to keep workspace clean: - Archived forms stop accepting new responses - All existing data is preserved - Restore archived forms anytime - Filter to show/hide archived forms in folder view

How It Works (The Flow)

```
graph TD; A[Person types answer] --> B[AI reads it in real-time]; B --> C[Shows quality signal (Red/Amber/Green)]; C --> D[Suggests how to improve]; D --> E[Decides what question to ask next]; E --> F[Better input collected automatically];
```

Person types answer
